

## The Role of Diplomatic Terms in the Development of Linguistics

Musaev Akmalbek  
Researcher of NamMTI

**Abstract:** In the development of the field of linguistics, diplomatic terms have a great role. The lexicon of diplomatic terms contributes to the growth of our vocabulary and the development of the field of linguistics in a unique way. We know that each given concept is reflected by the term, and according to the definition of the term, the dictionary consists of a word or phrase that clearly defines certain concepts in "science, technology" and other fields.

**Keywords:** diplomatic terms, terminological units, general lexical system, language level

### Introduction

The field of linguistics connects the definition and study of the concept of the term and its development at the language level with all the linguistic processes related to the fields of science (music, medicine, technology, economy, sports, etc.) existing in the material and spiritual life of mankind. If we pay attention to the philosophical definition of the term, two signs are evident:

The first sign - with the help of the term, the results of knowledge (understanding) appear, which certainly acquires the meaning of the term.

The second sign - the term in the text helps to reveal new knowledge.

Each concept is represented by a term, and according to the definition of the term, the dictionary consists of a word or phrase that logically defines certain concepts in a specific field "science, technology" and other fields.

In fact, the word that is the basis of the term is considered an important factor, which concept, that is, which nomination, that is, based on the opinions of linguists, such a conclusion can be reached. It is known to us that the significant amount of terminological units consists mainly of lexemes formed from nouns.

"Terms are specific to a special network consisting mainly of nouns, as they represent the names of specific processes, events and actions. After all, in any scientific and technical terminological system, the principle of striving for accuracy and brevity is observed."

If we pay attention to the processes of naming the terms, we can see that they are actually made up of nouns: for example: Asylum - political asylum, Breaking relations - breaking of mutual relations. If we pay attention to each term, we will see that they are formed from nouns.

"In the process of development and improvement of terminology, specialists in two areas of professional activity directly participate: on the one hand, engineers, economists, manufacturers themselves, on the other hand, linguists who are concerned about the state of the national language and the terminology that is part of it."

Each term should have a clear and concise description of the characteristics of the subject or event. A term is included in the level of general dictionaries when it is inextricably linked with a certain scientific concept and when reflecting their theoretical concepts, the term forms the results of scientific research.

Terminology is a subsystem of the general lexical system of the language, which is reflected as a system of scientific terms. A constant close connection exists between terminology and common literary language. A term is encountered when it enters a non-specialized language domain to a connotation that leads to a full (determinologization) generalizing word.

Determinologization (de-terminization, loss of connection of a term with a scientific concept and turning it into a generalizing word) means cases of taking words and phrases from a certain terminological system and fully acquiring them in the language of fiction. In the field of linguistics, the phenomenon of determinologization arises for two reasons. One of them is explained by the external, i.e., extralinguistic process: the development of science and technology, the growth of their role in the life of society, and the wide dissemination of scientific knowledge. The second is linguistic, i.e., internal linguistics, which arose as a result of systematic connections and relations within the language. Today, in the methodology of foreign language teaching, the emphasis on teaching the language for special purposes has increased. In this case, it is important to study the terms related to the special field. This certainly corresponds to the first cause of the phenomenon of determinologisation in the field of linguistics. The development of science and technology is the reason for the emergence of various terms and their presentation in the field of linguistics with specific lexical units.

## Conclusion

The process of determinologizing is based on the level of involvement of the general public in the field of activity of a small professional group.

At the same time, in the field of electronics and cybernetics, there are differences between concepts in terminological systems that depend on the centuries-old history of the language developed depending on the long history, specific natural climate and other conditions, and the determinization of the term that appeared in the memory of one or two generations. The wide distribution of terminological vocabulary related to such areas and common vocabularies make it difficult to define certain boundaries.
